

Country fact sheet: Sweden

1. Total greenhouse gas emissions

Figure 1: Left hand side: Total greenhouse gas emissions (incl. international aviation) 1990-2020 (index 1990 = 100 %). Right hand side: Greenhouse gas emissions by sector¹ – historical emissions 1990-2019, proxy 2020, projections WEM 2021-2030 (Mt CO₂-eq).

¹ The sectors in the figure correspond to the following IPCC sectors: Energy supply: 1A1, 1B and 1C. Energy use in manufacturing industries: 1A2. Industrial processes and product use: 2. Transport: 1A3. Other energy use: 1A4, 1A5 and 6. Agriculture: 3. Waste: 5. International aviation: 1.D.1.a.

Figure 2: Share of emissions covered by the ETS and the ESD (2019).²

2. ETS emissions

Figure 3: ETS emissions 2005-2020 (Mt CO₂-eq).³

² Excluding international aviation and NF₃.

³ The scope of ETS was extended from 2013. To reflect the current scope of ETS, estimates made by EEA are included in the figures from 2005 to 2012. The estimates cover only emissions from stationary installations.

3. Emissions in Effort Sharing sectors

Figure 4: Left hand side: Emissions and targets under the Effort Sharing Decision/ Effort Sharing Regulation 2020 and 2030 as percentage change from 2005. Right hand side: Emissions, annual emission allocations (AEAs) and accumulated surplus/ deficit of AEAs under the Effort Sharing Decision 2013-2020 (Mt CO₂-eq).

4. Land use, land use change and forestry

Figure 5: Reported and accounted emissions and removals from LULUCF (Mt CO₂-eq.)⁴

Reported quantities under the Kyoto Protocol for Sweden show net removals of, on average, -41.4 Mt CO₂-eq for the period 2013 to 2019. In this regard, Sweden contributes with 12.0% to the annual average sink of -344.9 Mt CO₂-eq of the EU-27. Accounting for the same period depicts net credits of, on average, -0.4 Mt CO₂-eq, which corresponds to 0.3% of the EU-27 accounted sink of -115.0 Mt CO₂-eq. Reported net removals show small dynamics with no trend. Accounted net credits follow the same pattern with net debits in 2015. Sweden is one of 14 EU Member States that show net debits for at least one year in this preliminary accounting exercise.

The dominating reported activity is Forest Management with removals. Emissions by Deforestation are small and removals by Afforestation/Reforestation play a negligible role in the emission budget of the LULUCF sector. Removals by Forest Management and emissions by Deforestation show small variations but no clear trend over the seven-year period.

Debits by Deforestation are the highest accounting quantity followed by credits by Forest Management. In this preliminary simulated accounting exercise, potential credits by Forest Management of, on average, -10.8 Mt CO₂-eq per year are capped to -2.5 Mt CO₂-eq per year. Sweden is one of six EU Member States that exceed the cap of 3.5% from total emissions excluding LULUCF in the base year (1990). Credits by Afforestation/Reforestation depict smaller amounts. Debits by Deforestation showed an increasing trend between 2013 and 2015 but remained at a lower level for the years thereafter.

⁴ The differences between reported and accounted emissions from LULUCF under the Kyoto Protocol are described in the 'explanatory note on LULUCF – accounted and reported quantities under the Kyoto Protocol'.
