

Hungary

1) Key Highlights

- In 2022, GHG emissions in Hungary were 59.8 MtCO₂-eq, 6.9% lower compared to 2021.
- Net GHG emissions (i.e. including LULUCF) in 2022 were 42.0% lower than 1990 levels.
- Emissions covered by the Effort Sharing Regulation decreased by 5.1% compared to 2021.
- By 2050, net GHG emissions in Hungary are expected to be 4.4 tonnes per capita.

2) Greenhouse Gas Emissions

In 2022, approximated domestic greenhouse gas (GHG) emissions in Hungary were 59.8 MtCO₂-eq, 6.9% lower compared to 2021 and 7.7% below pre-pandemic levels. Overall, net domestic emissions, including the Land Use, Land Use Change and Forestry (LULUCF) sector, were 42.0% lower than 1990 levels.

In 2022, net GHG emissions per capita in Hungary were 6 tonnes of CO₂ equivalent, below the EU average of 8 tCO₂-eq. In the same year, the GHG intensity of GDP (i.e. net GHG emissions over GDP) was 531 gCO₂-eq/EUR, above the EU average of 247 gCO₂-eq/EUR.

Note: (1) Total net GHG emissions, including LULUCF and excluding international aviation. GHG inventory 1990-2021 and approximated GHG inventory 2022 (EEA). Real GDP in 2015-prices (AMECO). Population (Eurostat).

Projections submitted in March 2023 under the existing policy scenario (WEM) point to a reduction in net GHG emissions (including LULUCF) of -44% and -56% by 2030 and 2050, respectively, compared to 1990. Hungary did not submit emission projections with additional measures (WAM).

Trajectories are also important. By comparing the cumulative projected net GHG emissions between 2022 and 2050 with a linear trajectory to climate neutrality by 2050, Hungary shows an overshoot of 74% (i.e. cumulative projected emissions are higher than those from a linear trajectory).

3) Greenhouse Gas Emissions by Sector

	1990 (MtCO ₂ -eq)	2005 to 1990 (% change)	2015 to 2005 (% change)	2022 to 2015 (% change)	2022 to 1990 (% change)
Energy	20.9	-4%	-31%	-23%	-49%
Industry	24.8	-46%	-17%	-8%	-58%
Transport	9.0	35%	1%	23%	68%
Buildings	22.4	-19%	-32%	-5%	-47%
Agriculture	10.1	-40%	9%	-4%	-37%
Waste	4.1	14%	-15%	-6%	-9%
LULUCF	-3.4	(absolute change) -2.6	(absolute change) 0.3	(absolute change) -1.0	(absolute change) -3.3
International aviation	0.5	63%	-33%	39%	52%

Notes: (1) Energy sector refers to electricity and heat production and petroleum refining. (2) Industry includes fuel combustion in manufacturing and construction and emissions in industrial processes and product use. (3) Buildings includes emissions from energy use in residential and tertiary buildings, and energy use in agriculture and fishery sectors. (4) For LULUCF, the table reports differences between the given years in absolute values (MtCO₂-eq). Negative values indicate a reduction of net emissions or an increase in net removals.

In 2022, the highest contribution to GHG emissions in Hungary came from the transport sector (26%), followed by the buildings sector (20%) and the energy sector (18%), while LULUCF net removals amounted to 11.3% of total GHG emissions.

Between 2015 and 2022, the sectors which contributed the most to the change in net GHG emissions (i.e. -6%) were energy, for which emissions fell by 23%, and transport, where emissions increased by 23%.

4) Emissions under the EU Emissions Trading System (ETS)

The EU ETS is an EU-wide market instrument to provide an incentive for emission reductions and transformative investments in the covered sectors. This means that it is largely the market that determines where in the EU the emission reductions take place, outside the control of Member States. However, Member States may adopt complementary (sectoral) policies in addition to the ETS's carbon price signal.

In 2022, stationary installations (e.g. power generation and manufacturing industry) in Hungary emitted 15.6 MtCO₂-eq (equal to 26% of total GHG emissions in Hungary). This is 11.7% lower compared to 2021 and 20.3% below pre-pandemic levels. By 2022, emissions from stationary installations were down by 18.7% against the 2013 level (i.e. -46.9% to the 2005 level). Aviation emissions covered by the EU ETS were 82% lower compared to 2021 and 6% below the 2019 level.

In parallel, Hungary has raised over EUR 1.76 billion in auction revenues since 2013, available for further climate action and energy transformation. Hungary reported that an average of 47% of revenues was spent for climate and energy purposes over the same period. (*)

MtCO ₂ -eq	2013	2021	2022
Power installations	14.3	11.6	10.9
% change since 2013	-	-18.9%	-23.8%
Industrial installations	4.8	6.0	4.7
% change since 2013	-	24.4%	-3.7%
Aviation (**)	1.10	1.23	2.23
% change since 2013	-	11.9%	103.4%

(*) 50% of the revenues are spent on climate and energy (any revenues not spent are carried over to future years) and the remainder goes to the national general budget. Amounts included in the latter can be spent on climate change and energy are not covered here. (**) ETS emissions from aviation include flights within the European Economic Area (EEA) and outgoing flights to Switzerland and to the UK.

5) Emissions in Effort Sharing Sectors

In 2022, emissions from sectors under the Effort Sharing Regulation (ESR), which excludes ETS and LULUCF emissions and removals, were 74% of total emissions in Hungary compared to 62% for the EU as a whole.

In 2022, effort sharing approximated emissions in Hungary were 44.2 MtCO₂eq, 5.1% lower than in 2021 and 1.5% below the pre-pandemic level.

Notes: (1) Small industry includes emissions from energy industries, manufacturing and construction, and industrial processes, that do not fall under the EU Emission Trading System. (2) Transport includes emissions from domestic transport activities, excluding CO₂ emissions from aviation. (3) Buildings includes emissions for heating buildings under the ESR.

In 2022, the largest contribution to the absolute change in ESR emissions came from buildings, for which emissions decreased by 12.1%, and transport, with emissions increasing by 7.7% compared to 2021.

In 2022, buildings accounted for 27% of total ESR emissions in Hungary, and transport accounted for 34%.

Note: (1) 2022 ESR emissions are based on approximated inventory reports and the European Environment Agency (EEA)'s calculation of ESR emissions. The approximated emissions can, therefore, deviate from Member States' reported emissions. (2) Projections as reported by Member States under Reg. (EU) 2018/1999, compiled and checked by the EEA. (3) WEM = with existing measures, WAM = with existing and additional measures.

The Effort Sharing Regulation (ESR) sets the 2030 ESR emission reduction target for Hungary to 19%, compared to 2005 levels. GHG projections submitted by Hungary in March 2023 under the existing measures scenario (WEM) point to a 12% decrease in ESR emissions by 2030 compared to 2005 levels, less ambitious than its ESR emission reduction target by 6 percentage points. Hungary did not submit GHG emission projections considering additional measures (WAM).

6) Land Use, Land Use Change and Forestry (LULUCF)

Based on final inventory data, in 2021, Hungary reported net removals of 7.20 MtCO₂-eq in the land use, land use change, and forestry sector (LULUCF). Based on approximated data, in 2022, net removals from the LULUCF sector were 6.65 MtCO₂-eq.

Notes: (1) Figure 1 shows net reported emissions and removals for the LULUCF sector. Net removals are expressed as negative numbers and net emissions as positive numbers. (2) Figure 2 shows the accounted emissions and removals for the LULUCF sector in 2021. Computation of the accounts per land use category, applying the standardised rules in the LULUCF Regulation (EU) 2018/841. The input data for this analysis have been extracted from the EU Greenhouse Gas Inventory Report 2023 for 1990-2021 based on final Member States' inventory submissions under the EU Governance Regulation (EU) 2018/1999. Seven Member States report 2021 data as approximated data for 2022. (3) Figure 3 shows projected progress with existing measures (WEM) and with additional measures (WAM) in relation to the national 2030 target. The LULUCF Regulation sets out binding national 2030 targets for each Member State encompassing all emissions and removals in the LULUCF sector (Art. 4.3). The targets are specified in Annex IIa of the LULUCF Regulation. Individual targets are derived from the EU-wide target of -310 MtCO₂-eq net removals by 2030, Member States' average historic net removals from their GHG inventories for the years 2016, 2017 and 2018 and the countries' share of total EU managed land area.

With current LULUCF accounting rules – with a limited scope – applicable to the period 2021 to 2025, the provisional ‘accounted’ balance for 2021 using the 2023 GHG inventory submission produced an accounted credit of 4.1 MtCO₂-eq.

Managed Forest Land and Afforested Land were the dominating land activities, with accounted net removals of 3.9 and accounted net removals of 1.1 MtCO₂-eq, respectively.

2023 LULUCF projections for Hungary show net removals in 2030 of 3.6 MtCO₂-eq with existing measures (WEM), leaving a gap of around 2.2 MtCO₂-eq to the estimated 2030 net removal target of 5.8 MtCO₂-eq. In March 2023, Hungary did not submit projections with additional measures (WAM).

7) Policies and Measures

In 2023, Hungary reported 124 single policies and measures (PaMs), representing an increase of 41% compared to 2021. As of 2023, 4% of the reported PaMs are planned but not yet implemented.

Ex-ante emission savings

Hungary did not estimate an expected emission reduction effect for any of its single or group PaMs.

Investment needs

Hungary estimates the investment need for 17% of its single and group PaMs. It estimates the initial investment requirement at EUR 17352.5 ml. Actual investments up to and including 2021 amount to EUR 5663.4 ml., with EUR 10284.6 ml. remaining to be implemented at this date.

More information and visualisations are available at the EEA integrated national energy and climate policies and measures data viewer.

8) Climate-Neutrality Dashboard

Hungary	Total net GHG emissions 2022-1990 (% change)	Total net GHG emissions 2022-2015 (% change)	GHG intensity of GDP 2022-2015 (% change)	Projected net GHG emissions by 2030 (tonnes per capita)	Projected net GHG emissions by 2050 (tonnes per capita)	Overshoot vs. linear trajectory (net GHG emissions 2022-2050)	Overshoot vs. non-linear benchmark (total GHG emissions 2022-2050)	Target year for climate neutrality (NECP progress reports, national long-term strategies or *** other sources)	Legal status of the climate-neutrality target (based on the Net-Zero Tracker)
	-42%	-6%	-6%	5.4	4.4	74%	59%	2050	In law
EU27	-32%	-10%	-20%	5.1	3.6	34%	40%	2050	In law

Note to the table: (1) Historical GHG emissions and removals (1990-2022) are based on the EEA's 2023 GHG Inventory and Approximated emissions and removals. (2) GHG intensity of GDP (gCO₂-eq/EUR2015) uses net GHG emissions (i.e. including LULUCF and excluding international aviation). Real GDP and population data from Eurostat. (3) GHG emission projections as submitted in 2023 by Member States under Art. 18 of the Governance Regulation considering additional measures (WAM). EU Population in 2050 is based on the latest Eurostat population projections. (4) The overshoot vs. a linear trajectory compares, for each Member State, the cumulative projected net GHG emissions (including LULUCF) between 2022 and 2050 with a linear trajectory starting from the 2021 emission level to zero by 2050. The overshoot against a non-linear indicative benchmark compares the cumulative projected GHG emissions (excluding LULUCF) with an indicative pathway to climate neutrality based on the scenarios proposed by the European Scientific Advisory Board on Climate Change, and then distributed across Member States according to the country's share of EU emissions in the core policy scenario supporting the initiatives delivering the European Green Deal. Projections consider, where available, the impact of both existing and additional policies and measures. (5) Target dates to achieve climate neutrality as in the NECP progress reports or, with an asterisk **, when from other unofficial sources (Net-Zero Tracker: <https://zerotracker.net/>).

9) Financing Climate Action

Cohesion policy

Hungary's planned financing for climate action

(EU financing & national co-financing - 2021-2027 Cohesion Policy)

The chart presents information on investment plans and achievement targets from adopted programmes. Financing for cohesion policy uses a categorisation to provide thematic information on the finances planned.

Major Innovation Fund projects

n.a.

Major Modernisation Fund projects

Energy storage instalments for grid security	The investment proposal aims to support storage of part of the current overflow of electricity produced by renewable capacities	EUR 51.4 ml.
Energy efficiency improvements of district	The investment proposal concerns a scheme for the period 2022-2030 relating to modernisation and energy improvements of district	EUR 22.9 ml.
The modernisation and development of renewable	The scheme relates to investments into: - Connecting district heating systems in cases where at least one is supplied by renewable heat (fully or partially) - establishing new	EUR 14.3 ml.

Recovery & Resilience Facilities

RRF allocations (EUR billion)	Grants:	Loans:	% of GDP
	7.20	-	4.7

RRF contribution to the Green pillar in Hungary (€ bn)

This graph displays: 1) the estimated cost of measures attributed by the Commission, in consultation with the Member State, to the green pillar either as primary or secondary assignments; and 2) how disbursements under the RRF (excluding pre-financing) relate to the green pillar.

Major green transformation RRF recipients

Magyar Máltai Szeretetszolgálat Alapítvány	Construction and renovation of social housing, improvement of housing conditions, Production and use of renewable energy in disadvantaged municipalities, Promoting employment and skills	EUR 97.9 ml.
MVM Démasz Áramhálózati Kft.	Classic and smart grid development of transmission system operator and distribution system operators	EUR 35.3 ml.
KTI Magyar Közlekedéstudományi és Logisztikai	Deployment of a single national tariff, ticketing and passenger information system for bus and rail by the National Public Transport Authority	EUR 1.5 ml.
ORSZÁGOS VÍZÜGYI FŐIGAZGATÓSÁG	Construction of main water replacement systems, development of new networks and systems	EUR 0.4 ml.

Based on the list of the 100 final recipients receiving the highest amount of funding for the implementation of measures under the RRF per country as reported by the Member State in line with Article 25(a) of Regulation (EU) 2023/435 amending the Regulation (EU) 2021/241 on the establishment of the Recovery and Resilience Mechanism.
