

Country fact sheet: Austria

1. Total greenhouse gas emissions

Figure 1: Left hand side: Total greenhouse gas emissions (excl. international aviation) 1990-2018 (index 1990 = 100 %). Right hand side: Greenhouse gas emissions by sector¹ – historical emissions 1990-2017, projections 2018-2030 (Mt CO₂-eq).

Figure 2: Share of emissions covered by the ETS and the ESD (2017).²

¹ The sectors in the figure correspond to the following IPCC sectors: Energy supply: 1A1, 1B and 1C. Energy use in manufacturing industries: 1A2. Industrial processes and product use: 2. Transport: 1A3. Other energy use: 1A4, 1A5 and 6. Agriculture: 3. Waste: 5. International aviation: memo item.

² Excluding international aviation, CO₂ from domestic aviation and NF₃.

2. ETS emissions

Figure 3: ETS emissions 2005-2018 (Mt CO₂-eq).³

3. Emissions in Effort Sharing sectors

Figure 4: Left hand side: Emissions and targets under the Effort Sharing Decision/ Effort Sharing Regulation 2018, 2020 and 2030 as percentage change from 2005. Right hand side: Emissions, annual emission allocations (AEAs) and accumulated surplus/ deficit of AEAs under the Effort Sharing Decision 2013-2020 (Mt CO₂-eq).

³ The scope of ETS was extended from 2013. To reflect the current scope of ETS, estimates made by EEA are included in the figures from 2005 to 2012. The estimates cover only emissions from stationary installations.

4. Land use, land use change and forestry

Figure 5: Reported and accounted emissions and removals from LULUCF (Mt CO₂-eq.)⁴

Reported quantities under the Kyoto Protocol for Austria show net removals of, on average, -5.1 Mt CO₂-eq for the period 2013 to 2017. In this regard, Austria contributes with 1.2% to the annual average sink of -411.9 Mt CO₂-eq of the EU-28. Accounting for the same period depicts net credits of, on average, -4.3 Mt CO₂-eq, which corresponds to 3.9% of the EU-28 accounted sink of -111.9 Mt CO₂-eq. Reported net removals increased in 2017 to reach the highest value in the reported period, while accounted net credits show no noticeable trend.

Highest reported quantities are removals by Forest Management. Removals by Afforestation/Reforestation are still prominent while emissions by Deforestation play a minor role in the overall emission budget of the LULUCF sector. The only activity with some variability over the five-year period is Forest Management with the highest removals for 2017.

Credits by Forest Management and Afforestation/Reforestation are much higher than debits by Deforestation. In this preliminary simulated accounting exercise potential credits by Forest Management of, on average, -2.9 Mt CO₂-eq per year are capped to -2.7 Mt CO₂-eq per year. Austria is one of five EU Member States that exceed the cap of 3.5% from emissions of the base year (1990). Credits by Afforestation/Reforestation show a slightly increasing trend over the five-year period.

⁴ The differences between reported and accounted emissions from LULUCF under the Kyoto Protocol are described in the 'explanatory note on LULUCF – accounted and reported quantities under the Kyoto Protocol'.
